

Case study 2:-

Employee Salary Processing :-HR needs a utility to calculate an employee's monthly salary. Accept Basic Salary and calculate HRA (20%), DA (40%), and Net Salary.

Algorithm – Employee Salary Processing

1. Start.
2. Declare variables: basicSalary, hra, da, netSalary.
3. Input the Basic Salary.
4. Calculate HRA:
 - $\text{hra} = \text{basicSalary} \times 20 / 100$
5. Calculate DA:
 - $\text{da} = \text{basicSalary} \times 40 / 100$
6. Calculate Net Salary:
 - $\text{netSalary} = \text{basicSalary} + \text{hra} + \text{da}$
7. Display HRA, DA, and Net Salary.
8. Stop.

Pseudocode:-

BEGIN

DECLARE basicSalary, hra, da, netSalary AS FLOAT

INPUT basicSalary

hra = basicSalary * 20 / 100

da = basicSalary * 40 / 100

netSalary = basicSalary + hra + da

PRINT "HRA = ", hra

PRINT "DA = ", da

PRINT "Net Salary = ", netSalary

END

Test cases:- input/output combination.

```
PS C:\Users\khush\Desktop\PROJECT 1> gcc CASE_study-2.c -o CASE_study-2 ; if ($?) { .\CASE_study-2 }  
enter the basic_salary 30000  
net_salary=48000.000000HRA=6000.000000DA=12000.000000  
PS C:\Users\khush\Desktop\PROJECT 1> █
```

```
PS C:\Users\khush\Desktop\PROJECT 1> gcc CASE_study-2.c -o CASE_study-2 ; if ($?) { .\CASE_study-2 }  
enter the basic_salary 35000  
net_salary=56000.000000HRA=7000.000000DA=14000.000000  
PS C:\Users\khush\Desktop\PROJECT 1> █
```

```
PS C:\Users\khush\Desktop\PROJECT 1> gcc CASE_study-2.c -o CASE_study-2 ; if ($?) { .\CASE_study-2 }  
enter the basic_salary 40000  
net_salary=64000.000000HRA=8000.000000DA=16000.000000  
PS C:\Users\khush\Desktop\PROJECT 1> █
