

Case study 7:-

Package Delivery Cost Estimator:-A courier company charges delivery based on package weight. Accept weight (kg) and cost per kg, then calculate the total delivery charge.

Algorithm – Package Delivery Cost Estimator

1. Start.
2. Declare variables: weight, rate, totalCharge.
3. Input the package weight (kg).
4. Input the delivery rate per kg.
5. Calculate the total delivery charge:
 - $\text{totalCharge} = \text{weight} \times \text{rate}$
6. Display the total delivery charge.
7. Stop.

Pseudocode:-

BEGIN

DECLARE weight, rate, totalCharge AS FLOAT

INPUT weight

INPUT rate

totalCharge = weight * rate

PRINT "Total Delivery Charge = ", totalCharge

END

Test cases:- input/output combination.

```
PS C:\Users\khush\Desktop\PROJECT 1> gcc CASE_study_7.c -o CASE_study_7 ; if ($?) { .\CASE_study_7 }  
enter the weight 8  
enter the rate 45  
total charge =360  
PS C:\Users\khush\Desktop\PROJECT 1> █
```

```
PS C:\Users\khush\Desktop\PROJECT 1> gcc CASE_study_7.c -o CASE_study_7 ; if ($?) { .\CASE_study_7 }  
enter the weight 10  
enter the rate 50  
total charge =500  
PS C:\Users\khush\Desktop\PROJECT 1> █
```

```
PS C:\Users\khush\Desktop\PROJECT 1> gcc CASE_study_7.c -o CASE_study_7 ; if ($?) { .\CASE_study_7 }  
enter the weight 12  
enter the rate 30  
total charge =360  
PS C:\Users\khush\Desktop\PROJECT 1> █
```
